

Distributed Database Architectures

- Shared-Nothing Architecture

- Node has its own CPU, memory and storage
- Nodes communicate through network messages
- Example: MongoDB

- Pros

- High scalability
- No single point of failure
(each has its own components)

- Cons

- High network overhead
- Complex joins

- Shared-Disk Architecture

- Node has its own CPU and memory, but shares a common storage that all nodes can access
- Example: Oracle

- Pros

- Data is consistent (live in 1 storage)

- Cons

- Single point of failure
